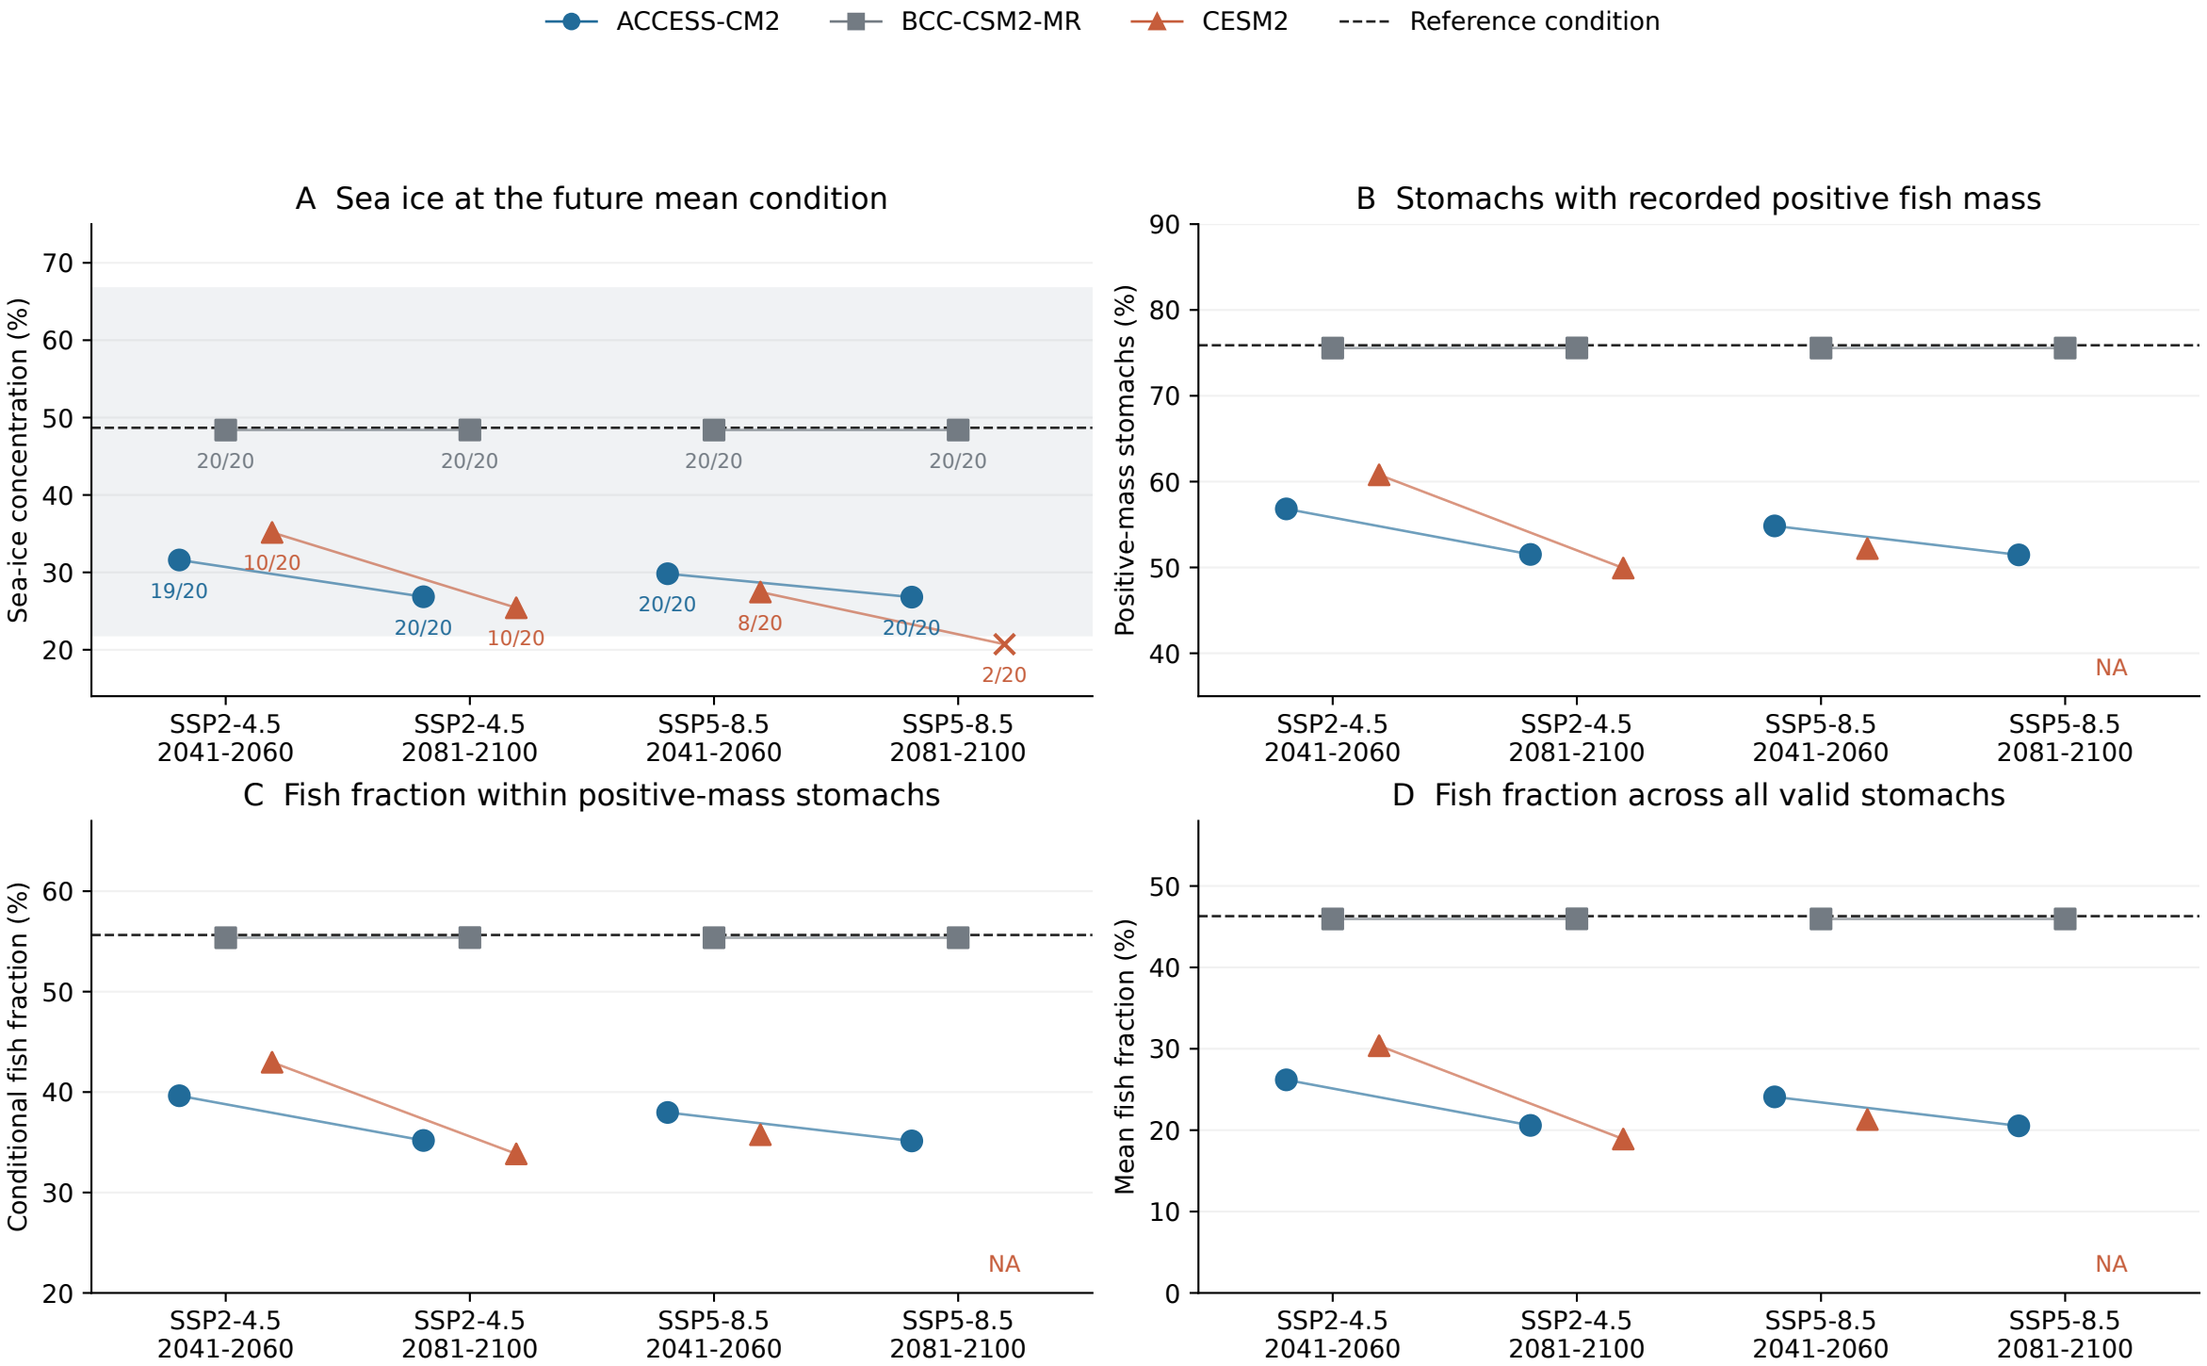
Conditional shifts in gentoo meal composition at Signy



Nine-season local relationships held fixed. Reference: observed 1995-2014 mean SIC; B-D reference values are fitted, not observed period means.
A shading: observed diet SIC range (21.90-66.68%). A labels: corrected annual climate values within that range / 20 years.
B-D: separate equal-season OLS responses at future mean SIC, not mean future annual diets; NA: mean SIC outside observed range.
Model differences are not probability intervals. BCC historical SIC is near zero, limiting its raw decline; no model is removed.
Coefficient-only change intervals and fractional-logit sensitivity are in the tables. Sources: BAS gentoo stomach records; OSI SAF; pinned CMIP6 stores.
